

Fotona4D® Treatment – How It Works

Fotona4D® rejuvenates the face from inside and outside by stimulating natural collagen production across multiple skin layers, leading to lifting, tightening, wrinkle reduction, and improved texture—all without surgery.

Overall Effects

- **Full-thickness collagen contraction** → long-lasting tightening and volumization.
- **Immediate visible improvement** → skin looks fresher and tighter right after treatment.
- **Progressive results** → full effect develops over 3–4 months as collagen remodels.
- **Safe, comfortable, and non-invasive** → no anesthesia, no needles, minimal downtime, usable year-round.

The Four Steps ("Dimensions")

1. **SmoothLiftin™ (Intraoral Er:YAG)** a. A non-ablative treatment applied inside the mouth. b. Stimulates collagen production from within, improving nasolabial folds, perioral wrinkles, and sagging jowls. c. Creates tightening from the inside out.
2. **FRAC3® (Nd:YAG)** a. Targets deeper skin imperfections using a fractional pattern. b. Initiates neocollagenesis (new collagen formation) without damaging the surface. c. Effective for age-related skin concerns like deeper wrinkles and pigmentation.
3. **PIANO® (Nd:YAG)** a. Provides gentle, full-thickness bulk heating of the skin. b. Tightens dermis and epidermis safely without surface damage. c. Improves skin firmness and lifting.
4. **SupErificial™ (Er:YAG Light Peel)** a. A precise, light resurfacing peel. b. Smooths fine lines, evens skin tone, and restores a youthful glow. c. Leaves the skin with a fresh, pearl-like finish.

Fotona4D® is a **non-invasive laser facelift** designed to rejuvenate the face without surgery, injectables, or downtime. It combines two laser wavelengths (Er:YAG and Nd:YAG) and works in **four synergistic steps** that target different layers of the skin and connective tissues.
